January 15, 2005

To Whom It May Concern:

My name is Dr. Richard A. Schwartz. I am a Chiropractic Physician, having graduated cum laude from Western States Chiropractic College in Portland, Oregon in June 1990. I have been in private family practice in Eugene, Oregon since September 1990, providing alternative health care for a wide range of physical conditions. I have studied numerous methods and techniques on a postgraduate level designed to be of help in these cases. Since beginning the use of NMT: the Feinberg Technique, as taught by use of the NMT seminar manual, my ability to be of help has increased dramatically, even in the most difficult of these cases.

The system works as disclosed if it is followed and applied as specifically taught by use of the NMT seminar manual. I have found that positive response to the application of this method is determined by accurate use of the pathways that are taught, and that if necessary, thoughtful troubleshooting usually provides good response and improved outcome over time.

I have found NMT: the Feinberg Method to be very useful in helping patients with a wide range of physical, biochemical and emotional problems, and providing supportive care without interference to almost any medical condition. These conditions, as seen in this clinic, range from simple neuromusculoskeletal pains, allergies and persistent infections to complex issues such as rheumatoid arthritis, myasthenia gravis, and acute myelogenous leukemia where any level of supportive care can be helpful.

The following two cases illustrate the usefulness in treating patients with NMT: the Feinberg Technique as taught by use of the seminar manual in both a simple and a complex case:

1. Patient B.W., female, age 48, presented 8/30/04 with onset symptoms of poison oak contact dermatitis after known accidental exposure. She expressed anxiety because the typical course of this allergy for her would involve at least 2 weeks of intense itching and a spreading, weeping rash. She commonly used cortisone cream to control the symptoms. She was treated at this time using a pathway from the NMT Seminar manual. She reported later in personal communication that the itching stopped soon after the treatment, and that the rash cleared in three days. Subsequent exposure to poison oak has produced only a very mild rash reaction with few individual vesicles

2. Patient K.J., female, age 62, had been treated at this clinic intermittently since September 1993. She presented a very complex case which included (but was not limited to) Degenerative Disc Disease, Multiple Chemical and Food Sensitivities, and Rheumatoid Arthritis, with difficult emotional affect related to a history of sexual abuse. Her pain level caused difficulty in rising from a seated position, and gave her an antalgic, shuffling gait. During this time she was treated with a wide range of alternative techniques and modalities that she could tolerate, with only limited palliative success. She consulted with other practitioners as well, with similar results. On 2/11/04, treatment with NMT: the Feinberg Technique was begun at a frequency of approximately one session every two weeks, and continues at this time. NMT pathways for this patient are individualized, complex, and reveal layers of physical, biochemical and emotional issues. Initial response was positive although gradual, with notable breakthroughs soon after the application of selected NMT treatment pathways. Progress has accelerated to the point where this patient is beginning to function at a physical level normal for her age. She reports greatly decreased pain levels and increased strength and energy. She is eating foods that would have previously caused severe joint pain. Laboratory testing of her blood Rheumatoid Factor shows a steady and significant decrease in inflammation. She expresses happiness, is hopeful and excited about her future, and attributes her recovery specifically to the application of NMT: the Feinberg Technique.

Sincerely,

Richard A. Schwartz, D.C.
